PRODUCT SELECTION DATA

- All inclusive offer : minimizing installation cost with all options factory fitted and tested
 - Easy integration in centralized zone
 - Best in class sound levels
- External Static Pressure : 100 to 350 Pa

Individual Comfort Module for Variable Air Volume Systems

42BJ ICM LEC 1.9 - 2.9 - 4.9

42BJ ICM LEC 1.9 - 2.9 - 4.9

Total cooling capacity 0.5-6.0 kW
Total heating capacity 0.5-12.2 kW

Le Module de Confort Individuel Carrier 42BJ MCI est un système de climatisation compact disponible en 3 tailles, permettant de traiter des locaux de 25 à 50 m².

Le 42BJ MCI LEC est constitué d'un caisson en tôle d'acier galvanisé recouvert intérieurement d'une isolation thermique et phonique (classement au feu M1).

Il comporte, un moto ventilateur centrifuge de type "LEC: Low Energy Consumption" (basse consommation énergétique).

Ce moteur à entraînement direct est à commutation électronique (communément appelés moteur EC), piloté par un signal 0-10 V lui permettant de fonctionner sur une longue plage de vitesses de rotation en variation de vitesse native, précise, simple et silencieuse, un filtre à air, une alimentation d'air neuf munie d'un régulateur de débit, une batterie froide, une batterie chaude et/ou électrique.

Ce module est raccordé sur le chantier par l'intermédiaire de gaines souples isophoniques (gaine de soufflage calorifugée) à un ou plusieurs plénums comportant un diffuseur linéaire parfaitement intégré dans le faux plafond du local à climatiser (gamme Moduboots CARRIER 35BD/35SR).

Les unités peuvent être disposées dans les faux plafonds ou planchers techniques, de préférence dans les couloirs, où elles sont reliées aux circuits d'eau chaude, d'eau glacée et d'air neuf.

Ces circuits implantés dans les zones de circulation du bâtiment, facilitant ainsi la maintenance, ne traversent jamais d'espaces climatisés. Seul le ou les diffuseurs 35BD/35SR, éléments inertes du système, se trouvent dans l'espace occupé. Ainsi, la maintenance est assurée en dehors de l'espace occupé et facilite la programmation pendant les heures d'occupation du bâtiment.

Le Module de Confort Individuel a été conçu pour être particulièrement silencieux, de plus, grâce à sa pression statique disponible, il peut être éloigné de l'espace climatisé.

Caractéristiques

■ Confort

Le 42BJ MCI LEC peut être équipé d'une régulation numérique Carrier NTC, chaque occupant aura alors à sa disposition une interface utilisateur à distance, placé sur son bureau ou au mur, lui permettant le choix individuel des conditions de confort:

- Température ambiante du local
- Fonction air forcé (renouvellement rapide de l'air du bureau)
- Mise en mode occupé ou inoccupé par l'utilisateur de chaque MCI LEC pour répondre aux exigences d'économie d'énergie.

Aquasmart Evolution permet de contrôler et d'optimiser chaque module en fonction des impératifs de l'exploitant ou des réglementations locales. Grâce à ce système central de surveillance énergétique, on peut à tout moment contrôler les conditions de confort et obtenir la meilleure économie

d'exploitation énergétique du système sans troubler le confort individuel.

Dans le cas où le produit est livré sans organe de régulation CARRIER, la vérification de la conformité CEM est de la responsabilité de l'intégrateur.

Qualité de l'air

■ La Qualité d'Air Intérieure (QAI)

Carrier s'attache à mettre au point un système de gestion de la Qualité de l'Air Intérieur (QAI) intégré aux appareils de climatisation. Une innovation majeure qui préfigure la climatisation de demain.

Dans cette application, chaque module de confort individuel (MCI LEC) est équipé d'une gestion de l'introduction de l'air neuf et d'une filtration de haute efficacité permettant de lutter efficacement contre tout type de polluant. Cela garanti ainsi, une bonne qualité d'air intérieur détaillée ci-dessous en 2 étapes:

- Une filtration haute efficacité: type F5 ou F6
- La modulation de débit d'air neuf: afin de maîtriser le débit d'air diffusé dans une pièce, les appareils CARRIER pourront être équipés d'un système de modulation de débit d'air neuf.

■ Three objectives:

To adjust the ventilation rate to the actual occupation in the rooms

To maintain good indoor air quality in order to ensure comfort and hygiene for the occupants.

To control energy consumption due to the air renewal in the rooms and adjust it to avoid "overventilation" of the building, and to minimise the operating costs especially during unoccupied periods.

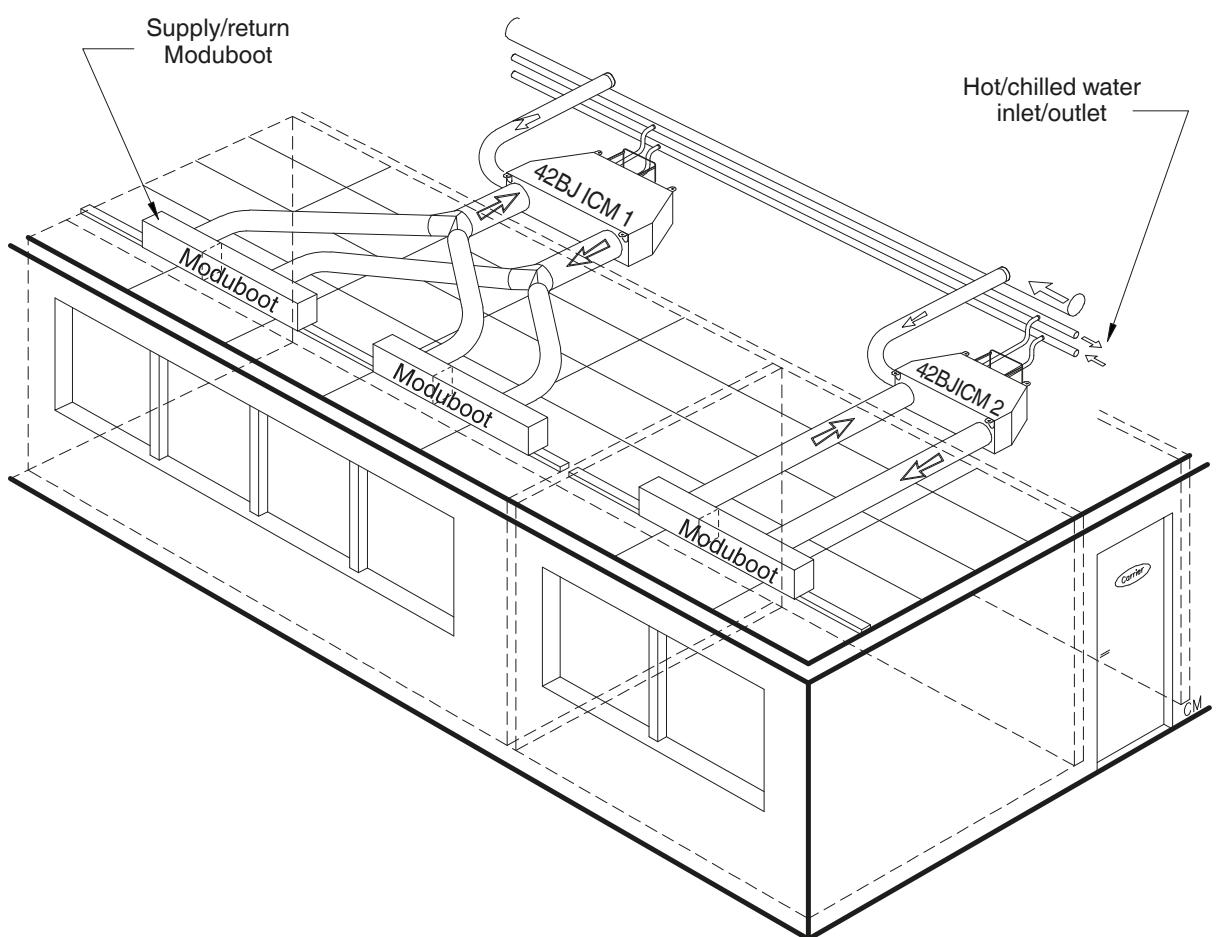

■ Operating principles

The occupants of a room release on average 0.0045 l/s (16,2 l/h) CO₂. A CO₂ sensor, placed in the return air duct of the terminal, checks the concentration in the air conditioned room. The measured concentration indicates the actual occupation of the room.

The sensor sends a signal to the numerical Carrier controller which in turn passes an action signal to the fresh air valve: if the CO₂ concentration is below a threshold value, the fresh air flow is minimal or zero, if it is above, the fresh air flow is increased up to the specified maximum.

■ Operating limits

Supply air temperature 12°C, when the unit is installed in a room with an ambient temperature of 27°C dry bulb and 65% relative humidity.

Main modules and components

■ Variable-speed LEC fan motor assembly

The 42BJ ICM LEC units are equipped with a variable-speed fan motor assembly controlled by a 0-10 V signal from the electronic Carrier controller.

■ Water coil

The water coil has aluminium fins mechanically bonded to copper tubes by expansion.

Water inlet and outlet connections are threaded 1/2" gas. Air purge valves are standard. The coil is integral with the drain pan and the coil access door to ease removal for service. Coils available are:

- two-pipe coils with changeover or for use with an electric heater.
- four-pipe coils.

■ Thermoformed condensate drain pan

The main pan is below the coil with an auxiliary pan below the valves. This monobloc construction prevents leaks. With the coil on the suction side of the fan to facilitate drainage, condensate has to be drained through a non-return flap valve. The difference in height between the main and auxiliary drain pans is enough to overcome the depression within the unit and dispenses with the need for an in-built siphon.

The auxiliary pan is insulated. The drain stub itself has 16 mm external diameter.

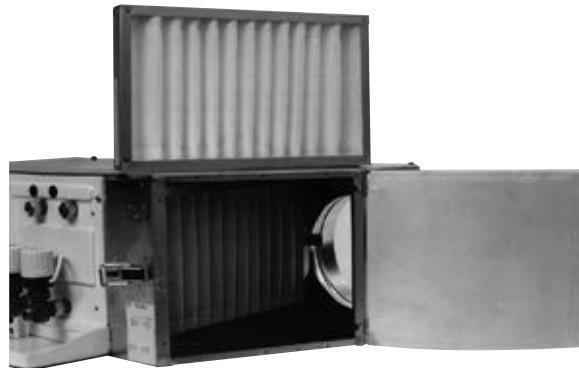

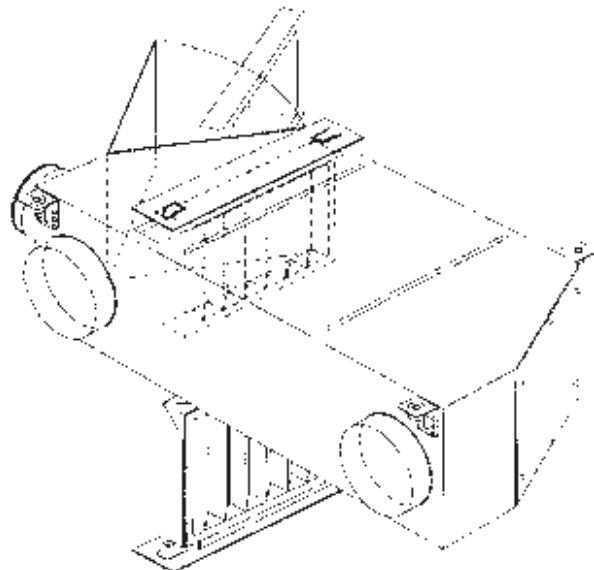

■ Filter and access

The 42BJ ICM is fitted with a high-efficiency F5 or F6 type filter.

Fire rating medium M1, metal frame

Three filter access options are provided on the 42BJ:

- From above for units in false floor voids
- From below for units in false ceiling voids
- From the side (all applications)

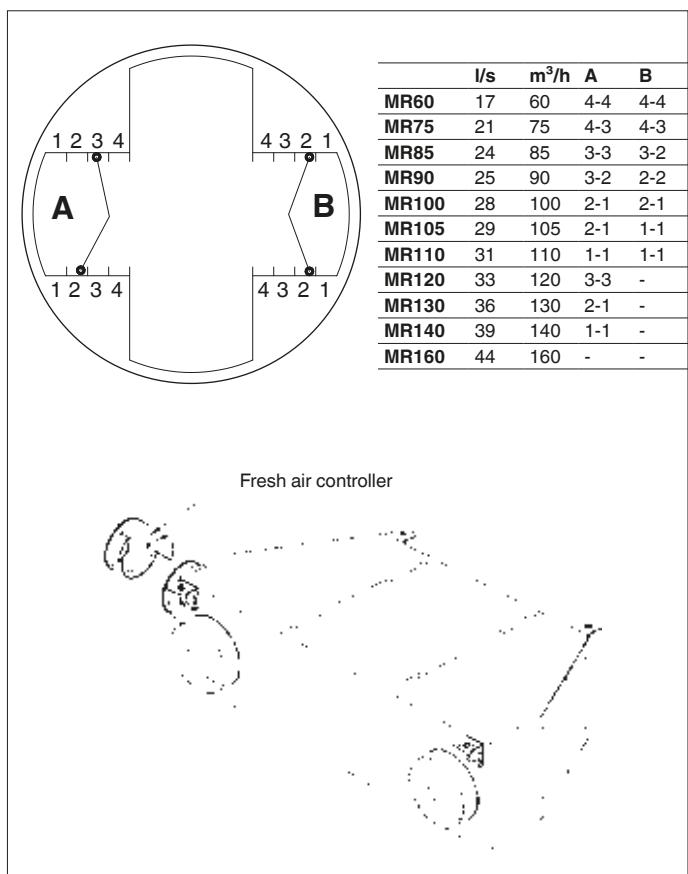

- Constant volume fresh air controller (option)
The ICM unit can be fitted with a constant fresh air flow controller allowing the number of air changes to be controlled accurately. It is vital to choose the correct constant fresh air flow controller for the intended occupancy of the room or zone.

The following range of controllers is available:

- 8.3 l/s or 30 m³/h (-10%; +20%)
- 16.6 l/s or 60 m³/h (-10%; +20%)

The fresh air supply is located upstream of the water coil. The collar which houses the flow controller is made of ABS and has the following diameter:

- 125 mm for the controller with 16.6 l/s (60 m³/h)
- 74 mm for the controller with 8.3 l/s (30 m³/h).

Important: If the ICM is fitted with a return air temperature sensor, the constant fresh air flow rate must not exceed 50% of the air flow rate delivered by the unit at minimum speed.

Note: The 16.6 l/s or 60 m³/h fresh air controller can be modified on site by removing or retracting of the two plastic restrictions in order to bring its capacity up to a maximum constant fresh air flow of 44.4 l/s (160 m³/h).

A label attached to the 42BJ shows how to modify the control of the two plastic restrictions.

Note: To operate correctly, the 8.3 l/s (30 m³/h) constant fresh air flow controller requires a differential pressure in the range 50 Pa to 200 Pa. The 16.6 l/s (60 m³/h) constant fresh air controller requires a differential pressure in the range 70 Pa to 200 Pa.

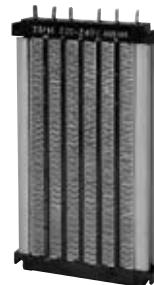

- PTC electric heater (option)

These are high-performance PTC electric heaters (PTC = positive temperature coefficient) which make use of two technologies: electric heating and surface temperature limitation (a state-of-the-art technology based on the use of ceramics).

The true dissipated power is then dependent on the temperature and flow rate of the incoming air.

The technology ensures totally safe self-regulation of the dissipated power. In addition, each electric heater is fitted with a self-resetting safety thermostat of the normally closed type that cuts out when the temperature rises to 70°C with an average differential of 20 K.

Caution: It is vital to disconnect the ICM from the general power supply before carrying out any work on the electric heater.

Enhanced comfort without stratification:
supply air temperature = 35°C

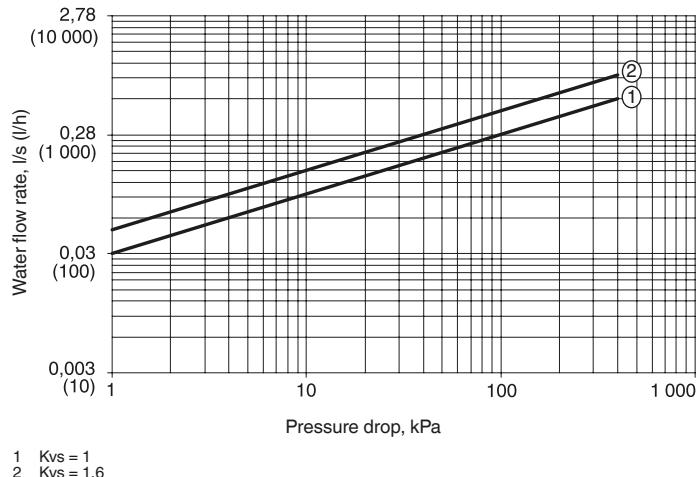

Technical specifications

Valves (option)

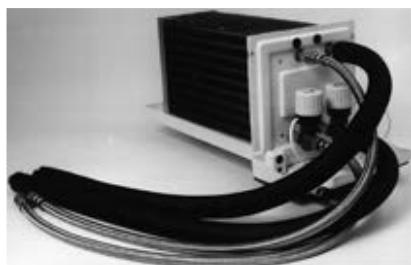

It should be noted that the valve body is the same for whatever controller option is chosen.

- Electrothermal actuator
The actuator is a 230 V a.c. on/off type. Linear movement is provided by the expansion and contraction of a wax element heated by an electrical resistor.
- Two-way 1/2" valve body
 - 1/2" male BSP connection for union nuts
 - Straight valve body with arrow indicating direction of flow embossed on valve body
 - Nominal size DN 15 for 1/2" valve
 - Fluid: water and glycol solution (max. 40% glycol)
 - Operating range: 2-90°C
 - Nominal pressure: PN 16 bar (1600 kPa)
 - $K_{vs} = 1.6$
- Three-way 1/2" valve body (with integral bypass)
 - 1/2" male BSP connection for union nuts
 - Straight valve body with arrow indicating direction of flow embossed on valve body
 - Nominal size DN 15 for 1/2" valve
 - Fluid: water and glycol solution (max. 40% glycol)
 - Operating range: 2-90°C
 - Nominal pressure: PN 16 bar (1600 kPa)
 - $K_{vs} = 1$

Water valve pressure drop

Flexible water pipes

- Materials
 - Pipes: MEPD-based elastomer (modified ethylene-propylene-diene)
 - Braid: 304L stainless steel
 - Insulation: cellular foam rubber with M1 fire rating (9 mm thick, flexible water pipes).
- Characteristics
 - Minimum bend radius: 106 mm
 - The flexible water pipes are designed for treated or untreated water (maximum 40% ethylene glycol or propylene glycol).
 - Maximum hot water temperature 90°C
 - Maximum operating pressure: 16 bar
 - 1/2" flat gas connections
 - Length: 1 m.

Control

The 42BJ ICM LEC can be supplied with a Carrier controller. The NTC controller offers functions to suit the various application requirements, summarised in the table below.

NTC controller functions		Availability
Control algorithms	Proportional-integral	X
Valve management	On-off actuators	X
	Modulating motors	O
Fan control	Three manual speeds	X
	Automatic fan speed selection	X
	LEC motor control	X
Main functions	Setpoint control	X
	Occupied/unoccupied mode	X
	Frost protection mode	X
	Window contact input	X
	Measurement of water inlet temperature for automatic seasonal changeover (2 pipes)	X
	Automatic seasonal changeover (4 pipes and 2 pipes + electric heater)	X
	Manual changeover	X
	Continuous ventilation within dead-band	X
	Periodical ventilation within dead-band	X
	Unit grouping	X
	Motorised louvre control	X
	On-site configuration	X
	Supply air temperature monitoring limiting	X
	Communication (CCN)	X
	Electrical heater loadshed	X
	Dirty filter alarm	X
	Alarm reporting	X
	IAQ control	O
	Demand control ventilation (DCV)	O

TH - Heating capacity, kW

SAT - Supply air temperature, °C
WF - Water flow rate, l/h

WF - Water flow rate, l/h

NOTES:

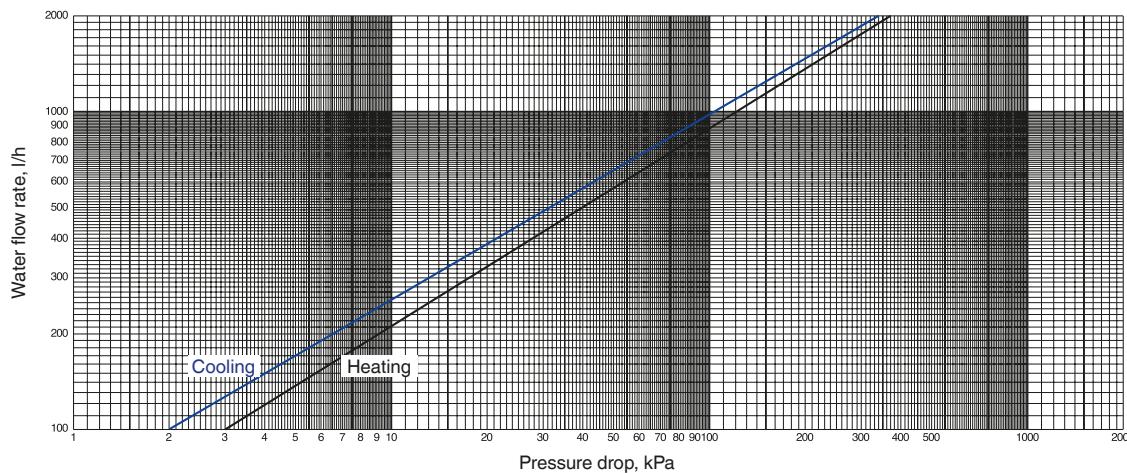

Carrier recommends that the supply air temperature be kept below 35°C in order to avoid the risk of stratification.
To convert $^{\circ}\text{F}$ to $^{\circ}\text{C}$, divide by 36000.

To convert l/h to l/s, divide by 3600

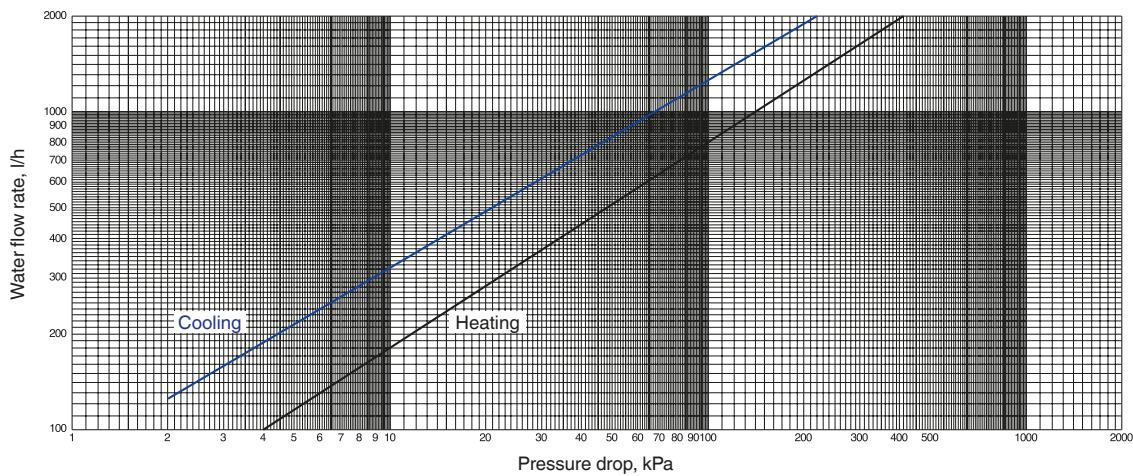

WARNING: The supply air temperature must not exceed 55 °C, otherwise damage may occur to the fan motor assembly.

Water coil pressure drop

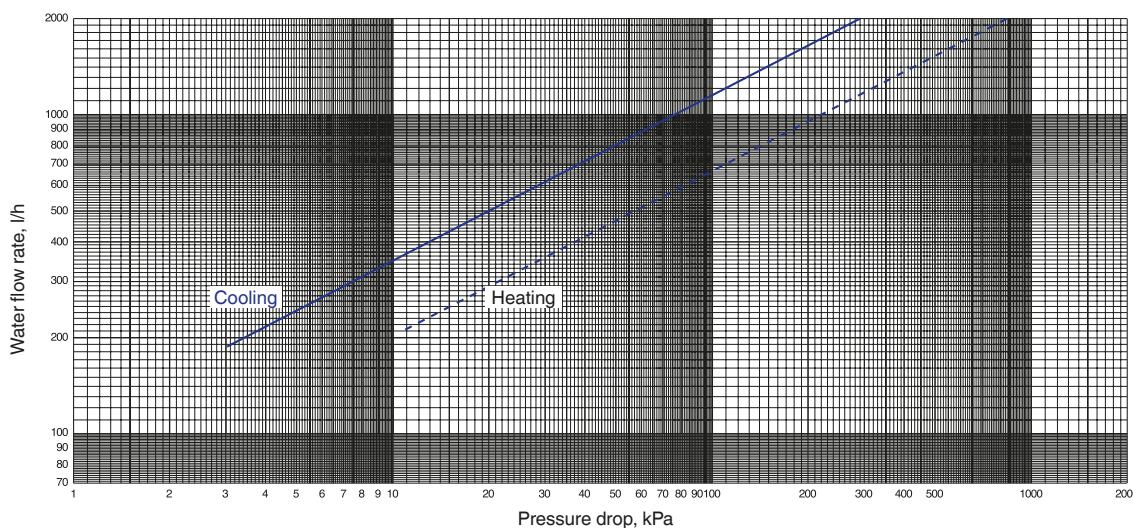

Water coil pressure drop curves, 42BJ MCI LEC size 1.9

Water coil pressure drop curves, 42BJ MCI LEC size 2.9

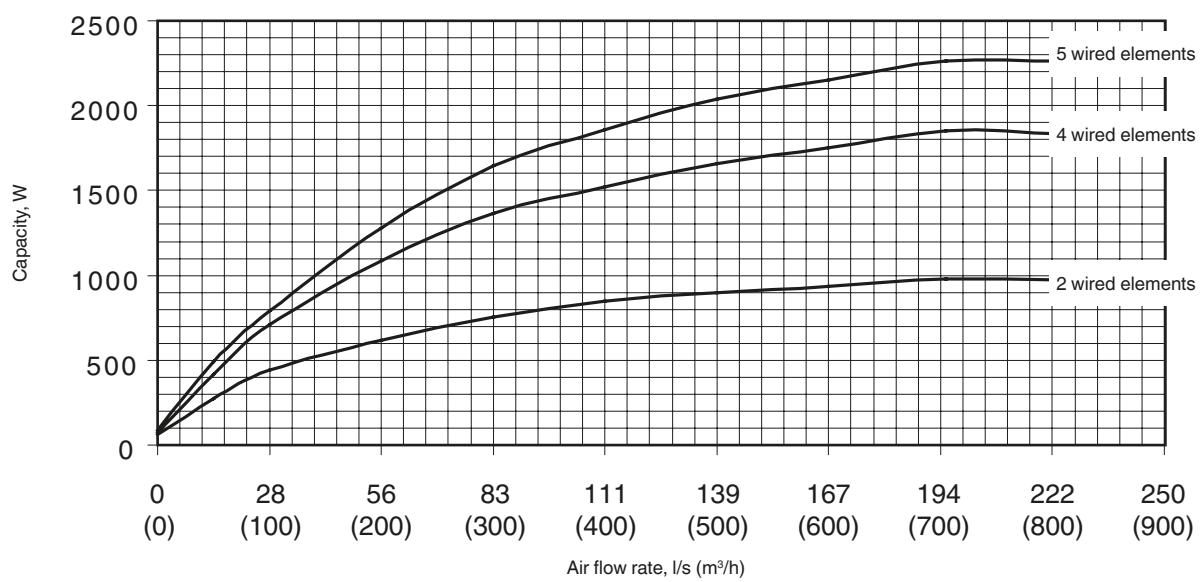

Water coil pressure drop curves, 42BJ MCI LEC size 4.9

NOTES:

The curves are plotted for the following conditions: entering hot-water temperature 50°C, entering chilled-water temperature 6°C.
To convert l/h to l/s, please divide by 3600.

Electric heater performances

NOTES:

Supply voltage = 230 V, entering air temperature = 19°C

Three wiring types are available: Low capacity - 2 wired elements, medium capacity - 4 wired elements, high capacity - 5 wired elements.

SUP Supply (dB re = 10^{-12} W)
RET Return (dB re = 10^{-12} W)
RAD Radiated (dB re = 10^{-12} W)

NOTES

- Measurements are based on the usual ISO standards and have been carried out without return air adapter.
- Any calculation of sound pressure levels within a room must take account of the sound deadening effect (absorption) in the duct, plenum, room and ceiling.
- For a selected speed the sound level can vary within a tolerance of ± 2.5 dB(A), depending on the available static pressure.
- In the case of ICMs fitted with electric heaters (in the suction side), for the same air flow apply the following correction factors:

Frequency, Hz	125	250	500	1 k	2 k	A
Correction, dB(A)	+ 2	+ 2	+ 1	0	+ 0.5	+ 0.5

Accessories

A broad range of accessories is available to facilitate the installation of the 42BJ ICM LEC. Contact your local Carrier representative.

■ Condensate drain pump

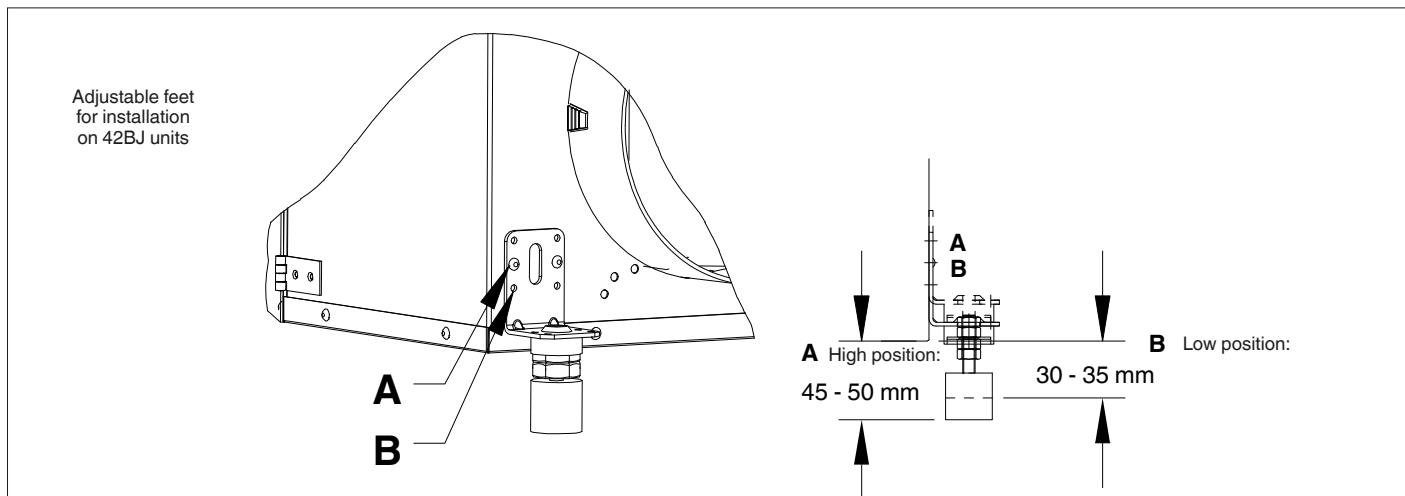

A 42BJ ICM can be fitted with a condensate drain pump, preferably before, but if necessary after the unit has been installed in a false floor or ceiling.

For the operation please refer to the installation instructions, order number M4281-76.

■ Adjustable feet for installation in a false floor void Provide side or top filter access: see codification below.

The 42BJ ICM LEC can be installed in a floor void. Adjustable feet with built-in vibration absorbers are available as accessories for installation on site. For further information please contact your local Carrier representative.

Guide specification

- The performance of each 42BJ ICM LEC unit supplied shall conform to the published technical and performance data.
- The casing of 42BJ ICM LEC units shall be made of galvanised steel, thermally and acoustically insulated, and shall provide adequate access to all components for maintenance and repair. All units shall have suspension lugs with flat rubber pieces to absorb shock and vibration.
- The connection collar for the supply and return air ducts has a diameter of 2 x 199 mm for sizes 1.9 and 2.9, and 2 x 249 mm for size 4.9.
- The fresh air connection collar shall be 125 mm in diameter and located upstream of the air filter and upstream of the heat exchange coils to enable the fresh air to be conditioned.

It shall be connected to the main primary air distribution duct via the extending flexible pipe. The fresh air flow must be between 8.3 and 44.4 l/s (30 and 160 m³/h).

- Each 42BJ ICM LEC unit supplied shall be fitted with a changeover heating or cooling coil, or a monobloc heating or cooling coil, or a cooling coil that is used with an electric heater. Water coils shall have manual bleed valves.
- The one-row cooling coils and five-row heating coils shall be made of copper tubes and aluminium fins. The operating pressure for water shall not exceed 10 bar (1000 kPa).
- The condensate drain pan beneath the coil and valves shall be monobloc and made of ABS to prevent the possibility of leaks.
- The two-way or three-way motorised water flow control valves shall be provided with flexible water pipes fitted with 1/2" threaded nuts to simplify site connections and maintenance work. Actuators shall be of the electrothermal type.
- Each 42BJ ICM LEC unit shall have a disposable high-efficiency F5 or F6 type air filter and M1 fire rating.

- Access to the filter shall be from the top, bottom or side of the unit, according to choice.
- The fan shall be a centrifugal, single-wheel type with single or double inlet. The available static pressure shall be sufficient to enable units to be installed outside the air conditioned space in order to simplify maintenance.
- The direct-drive fan motor is of the low-energy consumption (LEC) type. This direct-drive motor is electronically commutated (commonly referred to as EC motor), piloted by a 0-10 V signal that permits operation with a wide range of rotational speeds, varying from the base setting and is precise, simple and quiet.
- Electrical connections carried out on 42BJ ICM LEC units shall be the quick connection type in order to simplify maintenance.
- The communicating Carrier numerical controller shall use the CCN (Carrier Comfort Network) communication protocol.
- This controller shall provide the following functions:
 - Control of the fan speed on the ICM between a set minimum and maximum hot or cold air flow.
 - Control of the water flow through the two or three-way, on/off type valves by reference to internal and external loads to maintain a constant ambient temperature in the air conditioned space.
 - On/off control or PTC electric heater capacity.
 - Control via a microterminal with numerical display or a wall-mounted thermostat.
- The power supply to the controller shall be 230 V a.c. ± 15%, single-phase, 50 Hz, to avoid the need for a transformer. The electric heater shall be controlled directly by the Carrier numerical controller to avoid the need for a power triac.

Order No.14290-20, 05.2016. Supersedes order No.: 14290-20, 11.2011.
